

Session 1 & 2 — Project Tasks - P4A 2026

These tasks are the firsts for complete the project. The purpose in the overall project is to create a “staging” area of data that is useful for analytics. This is often done to improve the performance when you don’t load unnecessary and some do some transformation using powerful resources. Also helps uniformization of the data for all consumers.

Tasks

1. Create a “staging” area for using in notebook

Create a table in your database called `postings_with_benefits` that has:

- All columns from `postings`
- A column with all benefits (can separate using `;`) from `jobs_benefits` (`jobs_benefits` and `postings` are connected by `job_id` column)
- Only rows that have the column `closed_time` with NULL value

Hint: I mention the INSERT with VALUES command, but for this task can be useful the command INSERT with SELECT command. Check for more details

https://www.w3schools.com/sql/sql_insert_into_select.asp

2. Text to SQL

- Create a Text2SQL prompt for `linkedin_jobs` database. Give 2/3 examples how to use the prompt created.
- Discuss the results
